This book is essential reading for anyone who builds network applications based on Netty. Netty has a powerful but finicky event-based model for sending data to and from the network. The framework looks simple when you start but under the covers are 378 KLOC of Java, which means a lot of hidden complexity. Netty in Action has great explanations of the event processing model, management of memory, and all major components in the data model.

Netty's API for data handling is exposed through two components - abstract class ByteBuf and interface ByteBufHolder. These are some of the advantages of the ByteBuf API: It's extensible for user-defined buffer types. Transparent zero-copy is achieved by a built-in composite buffer type. Capacity is expanded on demand.

Netty provides a TooLongFrameException, which is intended to be thrown by decoders if a frame exceeds a specified size limit. Listing 10.4 shows how a ByteToMessageDecoder can make use of TooLongFrameException to notify other ChannelHandlers in the ChannelPipeline about the occurrence

of a frame-size overrun.
