Such changes can be detected through histology, the microscopic study of tissue appearance, organization, and function. The Four Types of Tissues Epithelial tissue, also referred to as epithelium, refers to the sheets of cells that cover exterior surfaces of the body, line internal cavities and passageways, and form certain glands.

The tissue is avascular, meaning without blood vessels. Nutrient and waste exchange occurs through neighboring connective tissues by diffusion. The upper surface of epithelium is free, or exposed to the outside of the body or to an internal body cavity. The basal surface rests on connective tissue.

As may be obvious from its name, one of the major functions of connective tissue is to connect tissues and organs. Unlike epithelial tissue, which is composed of cells closely packed with little or no extracellular space in between, connective tissue cells are dispersed in a matrix. The matrix usually includes a large amount of extracellular material produced by the connective tissue cells that ...

Human anatomy deals with anatomical structures of the human body, including cells, tissues, organs, and organ systems. Anatomy is always linked to physiology, the study of how biological processes function in living organisms. Therefore it is not enough to be able to identify a structure, its function must also be understood.
